U.S. DEPARTMENT OF THE INTERIOR U.S. GEOLOGICAL SURVEY 45'500 000 FEET (WEST) 30' R. 8 E. |R 9 E. 30' 400 000 FEET (CENTRAL) 115°00′ PAYETTENATIONAL FORE KETCHUM 34 MI Base modified from U.S. Geological Survey, 1957 SCALE 1:250 000 Limited revision 1963 5 0 100,000-foot grids based on Idaho coordinate system, central and west zones 1995 MAGNETIC DECLINATION VARIES FOR THIS SHEET FROM 16°30' EASTERLY FOR THE CENTER OF THE WEST EDGE TO 16°00' FOR THE CENTER OF THE EAST EDGE. MEAN ANNUAL CHANGE IS 5' WESTERLY RESOURCE POTENTIAL FOR TUNGSTEN VEIN AND REPLACEMENT DEPOSITS IN THE CHALLIS 1°×2° QUADRANGLE, IDAHO

PROFESSIONAL PAPER 1525 PLATE 8

## **EXPLANATION OF RESOURCE POTENTIAL**

Area having resource potential for tungsten vein and replacement deposits—See table 23 for scoring of recognition criteria High potential—Areas 1,3

Moderate potential—Areas 4, 8, 9

Low potential—Areas 2, 5-7

Mine or prospect

1 Quartz Creek 2 Golden Gate

3 West End 4 Yellow Pine 5 Sulfide #10

6 Meadow Creek 7 Mary Blue

## LIST OF GEOLOGIC TERRANES

al Alluvial terrane

Eocene Plutonic terrane vo Challis volcanic terrane

ba Idaho batholith terrane

bs Black shale terrane

ca Carbonate terrane

ms Proterozoic terrane

Trans-Challis fault system terrane

Regions of overlap between carbonate terrane and black shale terrane

Mostly rock glaciers; alluvial fans; landslide debris; talus; and terminal, end, and lateral moraines. Also includes Miocene volcanic and sedimentary rocks and noncarbonate roof pendants in the Idaho batholith of undivided (Paleozoic? or Proterozoic?) age Terrane boundary

Boundaries of calderas and other volcano-tectonic structures—Dashed where approximately located

## **DEFINITIONS OF RESOURCE POTENTIAL**

High mineral resource potential exists in areas where geologic, geochemical, and geophysical characteristics favorable for resource accumulation are known to be present, or where enough of these characteristics are present to give strong support to genetic models favorable for resource accumulation and where evidence shows that mineral concentration—mineralization in the broad sense—has taken place (Taylor and Steven, 1983, p. 1269).

Moderate mineral resource potential exists in areas where geologic,

geochemical, and geophysical characteristics favorable for resource accumulation are known or can reasonably be inferred to be present but where evidence for mineralization is less clear or has not yet been found (Taylor and Steven, 1983,

p. 1269).

Low mineral resource potential exists in areas where geologic, geochemical, and geophysical characteristics are unfavorable, where evidence indicates that mineral concentrations are unlikely, or where requirements for genetic models cannot be supported (Taylor and Steven, 1983, p. 1269).

Unknown mineral resource potential exists where the level of knowledge, at an appropriate scale, is so inadequate that to classify potential as high, moderate, or low would be misleading (Taylor and Steven, 1983, p. 1269).

In some instances an assignment of no mineral resource potential for a particular ore deposit type or types has been given to specific areas within the Challis quadrangle. In these cases the occurrence of the particular ore deposit type is dependent on the presence of a specific lithology. Known absence of the type is dependent on the presence of a specific lithology. Known absence of the required rock type precludes the occurrence of the ore deposit.

Frederick S. Fisher and Kathleen M. Johnson
